(57) Abstract: It is possible to obtain a smooth video display not interrupted by a decryption key modification processing when performing a special reproduction such as fast-feed reproduction and search. There is provided and search. encryption/recording device information supply including: means (20) supplied with encoded data containing an encoding unit having an in-frame encrypted image (I picture) and other encoded image (P picture, B picture); encryption processing means (100) for encrypting the encoded data from the information supply means (20) for each predetermined encryption unit and modifying an encryption key for every one or more encryption units; and recording means (40) for recording the encrypted data. When the encryption key modification timing is in the middle of encryption of the in-frame encoded image (I picture), the encryption processing means (100) delays the key modification timing so that the encryption key modification timing is not in the middle of the in-frame encoded image (I picture).

(57) 要約: 早送り再生、サーチ等の特殊再生を行う際に、復号鍵の変更処理が介入しないスムーズな映像表示をなし得ること。 フレーム内符号化画像(Iピクチャ)
